Castellon.CH | Anonimator

FOR LABS, LIFE SCIENCE & UNIVERSITIES

AI-ready documents. Without sending identities.

Anonimator is a local gateway between your staff and cloud AI such as ChatGPT, Claude or Copilot. It pseudonymises personal data before anything leaves your premises, then restores the real data in the answer.

The external AI provider receives no identifying data; the key never leaves your premises.
Your data. Your rules. Your control.

The challenge

Researchers, lab teams and administrative staff want cloud AI to summarise reports and draft documents. But those documents contain personal data: names, dates, contact details, ID numbers, health information. Sending them as they are to an external provider raises hard questions.

- **Who sees the names in our documents?**
- **What about health data and data about minors?**
- **Cloud AI without uploading identities?**

How it works

1 Staff work as usual
Requests to ChatGPT, Claude or Copilot go through Anonimator, an OpenAI-compatible proxy on your premises.

→

2 Identities become placeholders
Names, emails, phones, IBAN, ID numbers, dates: `Maria Rossi → [PERSON_7f3a]`. If it can't check, nothing is sent.

→

3 Real data restored
The cloud AI answers with placeholders; Anonimator puts the real data back for your user.

Key benefits

Personal data detection
Names, emails, phones, IBAN, AHV/AVS, DNI/NIE, dates, licence plates.

Fail-closed by default
If Anonimator can't check a request, nothing is sent.

Re-identification under your control
Keys and mappings are managed in your infrastructure.

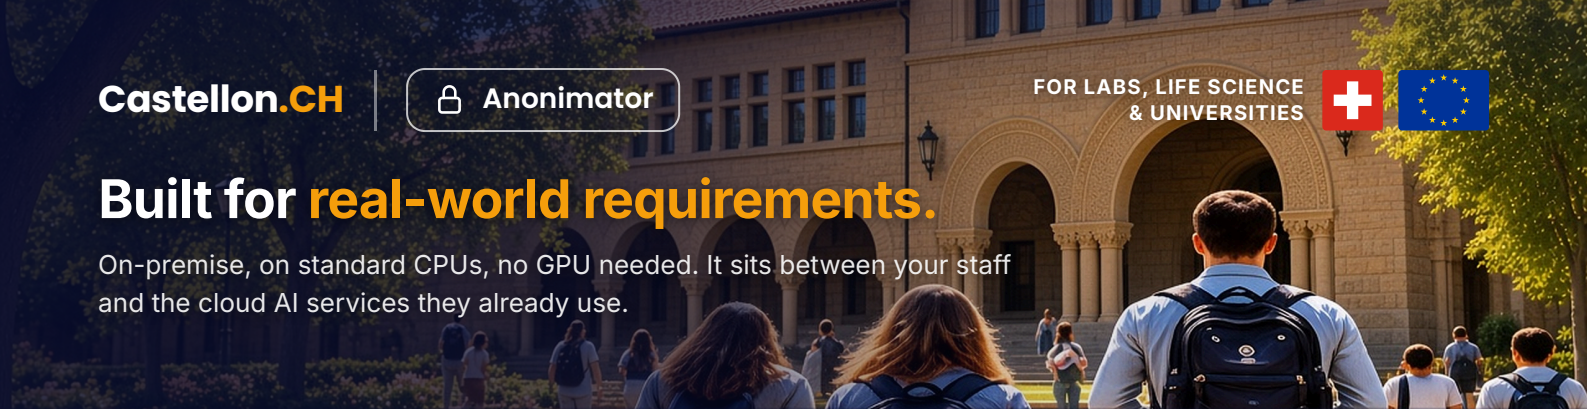

Purpose-aware policies
Strict handling of health data and data about minors.

Audit without personal data
Oversight without creating new records of identities.

Your formats, five languages
Word, Excel, PowerPoint, PDF, text; OCR optional. ES, DE, FR, IT, EN.

Castellon.CH | Anonimator

FOR LABS, LIFE SCIENCE & UNIVERSITIES

Built for real-world requirements.

On-premise, on standard CPUs, no GPU needed. It sits between your staff and the cloud AI services they already use.

How it differs

	DIY toolkits (e.g. Presidio)	Cloud DLP (Google, AWS, Azure)	Anonimator
Where your data is processed	Locally (library)	In the provider's cloud	On your premises
Fail-closed gateway in front of cloud AI	No, building blocks to assemble	No built-in AI proxy	Yes: nothing leaves unchecked
Real data restored in the AI answer	Only if you build it	Varies by service	Automatic
Re-identification key	Up to you	Data goes to the provider	Keys and mappings protected under your security policies

Other on-premise tools also keep data local. Anonimator's focus: one ready-to-run, fail-closed gateway with automatic re-identification, not a toolkit you have to assemble.

Typical use cases

Lab & research reports
Study documents, analytical results, clinical texts.

Documentation & correspondence
Applications, records and emails with personal data.

Internal knowledge
SOPs, technical documentation, project reports.

Teaching & administration
University staff using cloud AI with real files.

Built around your control

- Personal data is pseudonymised before anything leaves your premises
- Keys and mappings are managed in your infrastructure
- Fail-closed: if it can't check, nothing is sent
- Audit and oversight without new records of identities
- Helps with your data-protection obligations; it does not replace them

Pre-release · demo on request
Closed-source, on-premise product by Castellon.CH.

Anonimator performs pseudonymisation, not anonymisation: the data remains personal data for your organisation (CJEU, C-413/23 P). ChatGPT, Claude, Copilot and Presidio are trademarks of their respective owners.
