Castellon.CH | GLP Audit Proxy

FOR REGULATED LABORATORIES

Bring AI to your regulated lab environment with control and traceability.

GLP Audit Proxy is a self-hosted gateway that connects AI tools (e.g. ChatGPT, Claude, Copilot) to your laboratory systems, applying your access and full audit trails.

Your infrastructure. Your policies. Your control.
You decide what information can be sent to external AI providers.

The challenge

Laboratory teams want to benefit from AI, but public tools cannot be connected directly to internal systems with sensitive or regulated data. It is difficult to control data access, ensure traceability and meet internal policies and regulatory requirements.

- **How to use AI without exposing sensitive data?**
- **How to maintain control and traceability?**
- **How to fit into existing policies and regulated environments?**

How it works

1 AI tools connect through the proxy

Users work as usual with ChatGPT, Claude or Copilot, through GLP Audit Proxy. →

2 Policies and access control are applied

The proxy verifies what data can be shared, applies your policies (e.g. ELN, LIMS, files, databases, etc.) and filters requests. →

3 Traceable and reviewable interactions

All queries, data access and system actions are logged for audit and review.

Key benefits

Self-hosted in your infrastructure
You maintain control configuration and data sharing policies.

Fine-grained access control
Define what AI tools can access and which data they can use.

Complete audit trail
All interactions are logged for traceability and review.

Fits regulated environments
Designed to support laboratory governance and data protection policies.

Works with your systems
Integrates with ELN, LIMS, file repositories and other internal systems.

Flexible and standards-based
Based on open standards (MCP) and designed to adapt to your needs.

Castellon.CH | GLP Audit Proxy

FOR REGULATED LABORATORIES

Same AI capabilities. In a controlled environment.

Enable AI tools in your laboratory with a self-hosted proxy that enforces access controls, protects your data and provides full traceability.

Architecture

Key capabilities

Controlled access
Define and enforce what each AI tool can access.

Traceability by design
All queries and data access are logged and can be reviewed.

You control data sharing
You decide what information can be sent to external AI providers, based on your policies.

Integration with your infrastructure
Connect to ELN, LIMS, files, databases and instruments.

Support for regulated environments
Helps implement governance, security and traceability controls.

Flexible and extensible
Based on open standards (MCP) and designed to adapt to your needs.

GLP Audit Proxy helps **implement controls, traceability and data governance** in regulated environments such as GLP or GMP. It does not perform validation and does not, by itself, guarantee regulatory compliance.

Get in touch / Request a demonstration

Write to request a demonstration of GLP Audit Proxy for your laboratory or research institution.
