Castellon.CH | Anonimator

FOR UNIVERSITIES AND RESEARCH

Use AI in the cloud for research, teaching and administration, without sharing identities.

A local gateway between your people and cloud AI (ChatGPT, Claude, Copilot). It replaces personal data with markers before sending anything outside your infrastructure, and restores it in the response.

The external AI provider never receives any identifiable data; the key never leaves your premises.

The challenge

Researchers, educators and administrative staff want to use AI in the cloud with real documents: research files, applications, emails, etc. These often contain personal data protected by the EU GDPR and the Swiss Federal Act on Data Protection (FADP/LPD), and sending them to an external provider raises difficult questions.

- **Who are the people in the documents?**
- **Are there data about minors or health?**
- **How to use AI in the cloud without sharing identities?**

How it works

1 Works as you do

Your existing queries to ChatGPT, Claude or Copilot go through Anonimator, compatible with OpenAI APIs.

→

2 Identities are replaced with markers

Names, email addresses, phone numbers, ID numbers, dates, addresses... become markers such as [PERSON_7f3a]. If they cannot be verified, nothing is sent.

→

3 You get the real data back

The AI responds with markers and Anonimator restores the real data locally. Afterwards, the key is destroyed.

Key benefits

On your infrastructure, with standard hardware
No GPU required. Works as a proxy compatible with OpenAI.

The key stays in-house
Correspondences only in memory, within your infrastructure, destroyed after each query.

Fail-closed by design
If it cannot be verified, nothing is sent.

Purpose-based policies
Strict handling of health data and data of minors.

Personal data audit trail
Control without creating new records with identities.

Many formats and languages
Word, Excel, PowerPoint, PDF, text (ODF, CSV, RTF, HTML, email and optional OCR). EN, DE, FR, IT, ES.

Castellon.CH | Anonimator

Same AI capabilities. No identities shared.

Use cloud AI safely for research, teaching and administration, with a local pseudonymisation gateway on your infrastructure.

How does it compare?

	DIY kits (e.g. Presidio)	Cloud DLP (Google, AWS, Azure)	Anonimator
Where your data is processed	Locally (library)	Provider's cloud	On your infrastructure
Fail-closed gateway to cloud AI	No, requires custom setup	No AI proxy	Yes: nothing is sent if it cannot be verified
Real data in the response	Only with custom code	Depends on the service	Automatic
Re-identification key	Depends on you	Data at the provider	Per query, only in RAM, destroyed

Other on-premise tools also **keep data local.** Anonimator provides a unique **fail-closed gateway** with correspondences per query, only in RAM; no kit to assemble.

Supports the EU GDPR and Swiss FADP/LPD

Helps you fulfil your obligations under the EU GDPR (data minimisation, pseudonymisation as per Art. 4(5), security of processing as per Art. 32) and the Swiss Federal Act on Data Protection (FADP/LPD, nLPD).

Anonimator performs pseudonymisation (Art. 4(5) GDPR), not anonymisation: personal data remains data personal data after restoration, and is treated accordingly.

Get in touch / Request a demonstration

Write to request a demonstration of Anonimator for your university or research institution.
